## Discrete Mathematics

# Sequence

Shin Hong

# Sequences

- •A sequence of a set S is a function from the set of non-negative (or positive) integers to S
  - $a_n$ , a term of the sequence, denotes the image of n.
  - ex. consider the sequence  $\{a_n\}$  where  $a_n = \frac{1}{n}$

$$\{a_n\} = \{a_1, a_2, a_3, \ldots\} \qquad 1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4} \ldots$$

Sequence (Chapter 2)

# Strings

**Definition**: A string is a finite sequence from a finite set (an alphabet)

- Sequences of characters or bits are important in computer science
- The *empty string* is represented by  $\lambda$ .
- The string abcde has length 5.

Sequence (Chapter 2)

### Recurrence Relations

• A recurrence relation for the sequence  $\{a_n\}$  is an equation that expresses  $a_n$  in terms of one or more of the previous terms (e.g.,  $a_0$ ,  $a_1$ ,  $a_{n-1}$ ) for all non-negative integers n

• A sequence is called a *solution* of a recurrence relation if its terms satisfy the recurrence relation.

• The *initial conditions* for a sequence specify the terms that precede the first term where the recurrence relation takes effect.

Sequence (Chapter 2)

# Fibonacci Sequence

**Definition**: Define the *Fibonacci* sequence,  $f_0$ ,  $f_1$ ,  $f_2$ ,..., by:

- Initial Conditions:  $f_0 = 0$ ,  $f_1 = 1$
- Recurrence Relation:  $f_n = f_{n-1} + f_{n-2}$

**Example:** Find  $f_2, f_3, f_4, f_5$  and  $f_6$ 

#### **Answer:**

$$f_2 = f_1 + f_0 = 1 + 0 = 1,$$
  
 $f_3 = f_2 + f_1 = 1 + 1 = 2,$   
 $f_4 = f_3 + f_2 = 2 + 1 = 3,$   
 $f_5 = f_4 + f_3 = 3 + 2 = 5,$   
 $f_6 = f_5 + f_4 = 5 + 3 = 8$

## Questions about Recurrence Relations

• **Example.** Let  $\{a_n\}$  be a sequence that satisfies the recurrence relation  $a_n = a_{n-1} + 3$  for n = 1,2,3,4,... and suppose that  $a_0 = 2$ . What are  $a_1$ ,  $a_2$  and  $a_3$ ?

• Solution: We see from the recurrence relation that

$$a_1 = a_0 + 3 = 2 + 3 = 5$$
  
 $a_2 = 5 + 3 = 8$   
 $a_3 = 8 + 3 = 11$ 

Sequence (Chapter 2)

# Solving Recurrence Relations

• Finding a formula for a *i*-th term of a sequence generated by a recurrence relation is called solving the recurrence relation - such a formula is called a *closed formula*.

• Various methods for solving recurrence relations will be covered in Chapter 8 where recurrence relations will be studied in greater depth.

Sequence (Chapter 2)

# Subsequence and Substring

- A sequence  $S = \{s_1, s_2, ...\}$  is a subsequence of a string  $T = \{t_1, t_2, ...\}$  iff all terms of S are arranged in the same order in T
  - or, there exists a sequence  $A=\{a_1,a_2,...\}$  such that  $a_i < a_{i+1}$  and  $s_i=t_{a_i}$  for all  $1 \le i$

• A string u is a substring of a string s iff there exist strings w and v such that wuv = s

Sequence (Chapter 2)

# Ex. Financial Application

• Suppose that a person deposits \$10,000 in a savings account at a bank yielding 11% per year with interest compounded annually

• How much will be in the account after 30 years?

Let  $P_n$  denote the amount in the account after 30 years.  $P_n$  satisfies the following recurrence relation:

$$P_n = P_{n-1} + 0.11P_{n-1} = (1.11) P_{n-1}$$
  
with the initial condition  $P_0 = 10,000$ 

Sequence (Chapter 2)

# Financial Application

$$P_n = P_{n-1} + 0.11P_{n-1} = (1.11) P_{n-1}$$
 with the initial condition  $P_0 = 10,000$ 

#### **Solution**: Forward Substitution

$$P_1 = (1.11)P_0$$
  
 $P_2 = (1.11)P_1 = (1.11)^2P_0$   
 $P_3 = (1.11)P_2 = (1.11)^3P_0$   
:

$$P_n = (1.11)P_{n-1} = (1.11)^n P_0 = (1.11)^n 10,000$$
  
 $P_n = (1.11)^n 10,000$  (Can prove by induction, covered in Chapter 5)

$$P_{30} = (1.11)^{30} 10,000 = $228,992.97$$
